10.2 The labor supply of married women has been a subject of a great deal of economic research. Consider the following supply equation specification

$$HOURS = \beta_1 + \beta_2 WAGE + \beta_3 EDUC + \beta_4 AGE + \beta_5 KIDSL6 + \beta_6 NWIFEINC + e$$

where *HOURS* is the supply of labor, *WAGE* is hourly wage, *EDUC* is years of education, *KIDSL6* is the number of children in the household who are less than 6 years old, and *NWIFEINC* is household income from sources other than the wife's employment.

- a. Discuss the signs you expect for each of the coefficients.
- b. Explain why this supply equation cannot be consistently estimated by OLS regression.
- c. Suppose we consider the woman's labor market experience EXPER and its square, EXPER², to be instruments for WAGE. Explain how these variables satisfy the logic of instrumental variables.
- d. Is the supply equation identified? Explain.
- e. Describe the steps [not a computer command] you would take to obtain IV/2SLS estimates.
- **10.3** In the regression model $y = \beta_1 + \beta_2 x + e$, assume x is endogenous and that z is a valid instrument. In Section 10.3.5, we saw that $\beta_2 = \text{cov}(z, y)/\text{cov}(z, x)$.
 - a. Divide the denominator of $\beta_2 = \cos(z, y)/\cos(z, x)$ by $\operatorname{var}(z)$. Show that $\cos(z, x)/\operatorname{var}(z)$ is the coefficient of the simple regression with dependent variable x and explanatory variable z, $x = \gamma_1 + \theta_1 z + v$. [*Hint*: See Section 10.2.1.] Note that this is the first-stage equation in two-stage least squares.
 - b. Divide the numerator of $\beta_2 = \cos(z, y)/\cos(z, x)$ by $\operatorname{var}(z)$. Show that $\cos(z, y)/\operatorname{var}(z)$ is the coefficient of a simple regression with dependent variable y and explanatory variable z, $y = \pi_0 + \pi_1 z + u$. [Hint: See Section 10.2.1.]
 - c. In the model $y = \beta_1 + \beta_2 x + e$, substitute for x using $x = \gamma_1 + \theta_1 z + v$ and simplify to obtain $y = \pi_0 + \pi_1 z + u$. What are π_0 , π_1 , and u in terms of the regression model parameters and error and the first-stage parameters and error? The regression you have obtained is a **reduced-form** equation.
 - **d.** Show that $\beta_2 = \pi_1/\theta_1$
 - e. If $\hat{\pi}_1$ and $\hat{\theta}_1$ are the OLS estimators of π_1 and θ_1 , show that $\hat{\beta}_2 = \hat{\pi}_1/\hat{\theta}_1$ is a consistent estimator of $\beta_2 = \pi_1/\theta_1$. The estimator $\hat{\beta}_2 = \hat{\pi}_1/\hat{\theta}_1$ is an **indirect least squares** estimator.

er a.

P2〈0, B3 >0, P4 CO, BCO, P6 CO
